

Part 1: Pre-Test & Demographics (2 minutes)

The moderator introduces the session, states that we are testing the interface and not the user, and collects basic profile info.

1. Age: 19

2. Background / Field of Study or Work: IT apprentice

3. Tech Comfort Level:

☐ Low (Basic browsing)

☐ Medium (Regular student / staff web usage)

☒ High (Advanced user / Developer)

4. Do you regularly use any built-in accessibility features on your devices? (e.g., Dark Mode, Increased Contrast, Screen Zoom, Keyboard-only navigation)

Note responses:

Mostly dark mode, but otherwise not really. I sometimes use shortcuts.

Part 2: Task-Based Testing (10 minutes)

Observe the user's behavior closely. Do not guide them unless they are completely stuck for more than 1 minute.

Task 1: First Impressions & Visual Discovery (2 mins)

Instruction to user: "Please open the test page. Look around for a moment without clicking anything and describe what you see. What stands out to you?"

User Observations:

Title and a link at the top to return to the overview page. Body with a rotating square and additional text, and at the bottom left there is a box with the title "Site Preferences".

Task 2: Interaction Discovery & Reduced Motion (2 mins)

Instruction to user: "Imagine the spinning square on this page is distracting to you or making you feel uncomfortable. Try to find a way to stop it from spinning."

Moderator Check: * Do they hover/interact with the widget to expand it?

Success: ☒ Easily ☐ With Difficulty ☐ Failed

User Observations:

The user clicks on the square → nothing happens.

Next, he tries clicking on "Site Preferences" → He sees the "Reduced Motion" option and selects "Reduced Motion On" → The square stops rotating.

Task 3: Feature Exploration (2 mins)

Instruction to user: "Take a look at the settings panel again. What other options or features do you see available here? Briefly change one more setting of your choice to see what happens."

User Observations:

High Contrast On → The contrast is improved and the shadow of the components is removed.

Color Theme → Light and dark mode can be selected.

Color Blindness → The primary color changes slightly. Some colors are noticeably different and some only very minimally.

Reduced Motion → Was already tried and is clear.

Task 4: Accessibility / Keyboard Navigation (2 mins)

Instruction to user: "Now, please move your hands completely away from the mouse or trackpad. Using only your keyboard (such as the Tab, Spacebar, Enter, and Arrow keys), try to change the site layout to Dark Theme."

Moderator Check:

Success: ☒ Easily ☐ With Difficulty ☐ Failed

User Observations:

The user has difficulties using the arrow keys to change the selected option and tries it with the Tab key. He then realizes by himself that it works with the arrow keys.

Task 5: Free Exploration (1 min)

Instruction to user: "Feel free to click around or interact with anything else on this page for a moment before we finish up."

User Observations:

The user discovers the page transitions for Reduced Motion.

Part 3: Post-Test Questionnaire & Ratings (5 minutes)

Ask the participant to rate their experience and provide qualitative feedback.

1. Functionality & Clarity

"On a scale from 1 to 10 (1 = completely confusing, 10 = perfectly clear), how easy was it to figure out how to use the widget functionality?"

Score: 8 / 10

Follow-up: Was there anything unclear, confusing, or unexpected about how the panels opened or how the options worked? (e.g., *Did you realize you had to hover over the widget or click the summaries to see the options?*)

The functionality is clear. The element does not come across as very "clickable", since it looks similar to the background. Otherwise, the structure is clear. You can tell that the widget can be clicked once you hover the cursor over it.

2. Placement, Visual Styling & Size

"On a scale from 1 to 10 (1 = looks terrible/terrible placement, 10 = looks great/perfect placement), how would you rate the widget from a visual and positioning perspective?"

Score: 9 / 10

Follow-up: What could be improved visually or positionally? (e.g., *Is the bottom-left corner a good spot? Is it too small, too large, or blocking other content? Should the icon change?*)

The placement is good, so it does not feel intrusive and the location is especially well chosen for mobile devices. The appearance is good and not overdone, simple and clear with native HTML elements, without a library behind it. Very pleasant. Everything worked as intuitively assumed.

3. Contents

"What setting options would you think are important to have for such a widget in general?"

Reduced motion, contrast, color theme and color blindness are roughly the most important.

It might be useful if one could adjust the minimum font size.

Adjusting the font type would also be advantageous depending on the page.

4. Everyday Context

Question: "If this widget was present across all the websites you use daily, would you find it helpful, or would you find it annoying/intrusive?"

It would not bother me. Similar to the chat bubbles that are everywhere. You would probably get used to it after a relatively short time.

Whether I would need it depends on the page, if the website has poor contrast in its design.

What I would use most is the color scheme, since some pages have a bad dark mode or when the sun is very strong.

Also useful as a developer for testing the different designs.
