

Part 1: Pre-Test & Demographics (2 minutes)

The moderator introduces the session, states that we are testing the interface and not the user, and collects basic profile info.

1. Age: 28

2. Background / Field of Study or Work: *business informatics specialist*

3. Tech Comfort Level:

☐ Low (Basic browsing)

☐ Medium (Regular student / staff web usage)

☒ High (Advanced user / Developer)

4. Do you regularly use any built-in accessibility features on your devices? (e.g., Dark Mode, Increased Contrast, Screen Zoom, Keyboard-only navigation)

Note responses:

No, actually not. Dark mode, yes, I have that enabled.

Part 2: Task-Based Testing (10 minutes)

Observe the user's behavior closely. Do not guide them unless they are completely stuck for more than 1 minute.

Task 1: First Impressions & Visual Discovery (2 mins)

Instruction to user: "Please open the test page. Look around for a moment without clicking anything and describe what you see. What stands out to you?"

User Observations:

Black background, dark gray highlights, a rotating square in light blue and a button at the bottom where one can manage the page settings. And a back link to the previous page.

Task 2: Interaction Discovery & Reduced Motion (2 mins)

Instruction to user: "Imagine the spinning square on this page is distracting to you or making you feel uncomfortable. Try to find a way to stop it from spinning."

Moderator Check: * Do they hover/interact with the widget to expand it?

Success: [☒] Easily [] With Difficulty [] Failed

User Observations:

Probably you just click on "Site Preferences" at the bottom, then on "Reduced Motion" and set it to "off", ah no, "on", of course.

Task 3: Feature Exploration (2 mins)

Instruction to user: "Take a look at the settings panel again. What other options or features do you see available here? Briefly change one more setting of your choice to see what happens."

User Observations:

We have "Motion", that has to do with movement on the page

"High Contrast" for when something is not properly visible in order to find your way around better. As expected the contrast is increased and the focus is now on the essential parts of the page.

"Colorscheme" will allow switching between dark, light or other styles, like a red design or something like that. That will generally change the colors for the background and the text. It behaves as expected and changes the design. Default for me is dark, based on OS system settings.

With "Colorblindness" I don't know what to expect. I am not familiar with it. I assume that the colors are adjusted according to different color vision deficiencies. As I can see the color of the square changes in all 4 options.

Task 4: Accessibility / Keyboard Navigation (2 mins)

Instruction to user: "Now, please move your hands completely away from the mouse or trackpad. Using only your keyboard (such as the Tab, Spacebar, Enter, and Arrow keys), try to change the site layout to Dark Theme."

Moderator Check:

Success: ☒ Easily ☐ With Difficulty ☐ Failed

User Observations:

With "Tab" I get to "Site Preferences" and with "Enter" I can open the widget. I then move further with "Tab" to "Colorscheme", which I can again open with "Enter".

The user did not know that you have to use the arrow keys to navigate between radio buttons, the rest was clear.

Task 5: Free Exploration (1 min)

Instruction to user: "Feel free to click around or interact with anything else on this page for a moment before we finish up."

User Observations:

The user tries out the various color combinations from the themes and color blindness options and is surprised at how different the colors are.

Part 3: Post-Test Questionnaire & Ratings (5 minutes)

Ask the participant to rate their experience and provide qualitative feedback.

1. Functionality & Clarity

"On a scale from 1 to 10 (1 = completely confusing, 10 = perfectly clear), how easy was it to figure out how to use the widget functionality?"

Score: 9 / 10

Follow-up: Was there anything unclear, confusing, or unexpected about how the panels opened or how the options worked? (e.g., *Did you realize you had to hover over the widget or click the summaries to see the options?*)

The widget is self-explanatory and it is clearly evident what is happening. I give 9 points because everything was great. Colorblindness does not affect me, so I was not familiar with it.

2. Placement, Visual Styling & Size

"On a scale from 1 to 10 (1 = looks terrible/terrible placement, 10 = looks great/perfect placement), how would you rate the widget from a visual and positioning perspective?"

Score: 8 / 10

Follow-up: What could be improved visually or positionally? (e.g., *Is the bottom-left corner a good spot? Is it too small, too large, or blocking other content? Should the icon change?*)

I would have placed the widget at the top in the header. I read the page from top to bottom. Maybe it could be made more visually prominent. More clearly that it is a button.

Inside it is better, I think that is good like this. All can be opened at the same time. All combinations look good and are coordinated with each other. You cannot mess up the page.

3. Contents

"What setting options would you think are important to have for such a widget in general?"

The four existing options definitely. Otherwise I have never really dealt with this topic much, since I do not have any limitations.

The theme switch between dark and light is personally important to me.

Otherwise I cannot think of anything, in my opinion those are the most important things.

3. Everyday Context

Question: "If this widget was present across all the websites you use daily, would you find it helpful, or would you find it annoying/intrusive?"

It would not bother me and it would also not disturb me. In some cases I might even use it. Depending on the situation, the settings for "Reduced Motion" or the "contrast" are helpful for me. It does not bother me at all, it does not impair the page for me and it is very helpful for people who depend on such settings.
